

Thin Client Technology

Thin Client Technology

Corporations today invest a significant amount of time, money and resources into their IT infrastructure. As networking technology evolves over time, these changes become more noticeable within the desktop computer environment. What was state-of-the-art last year typically no longer meets today's business computing requirements. Applications increasingly require more horsepower to adequately deliver required functionality to the user base. Continuously upgrading end-user desktop computer hardware to keep up with today's ever-changing business model is extremely costly. By utilizing server-based computing and Thin Client Technology, businesses can reduce their overall cost, effectively enabling users to utilize network resources and applications without the continual upgrade of desktop systems every 24 to 36 months. Significant cost savings are achieved through the centralized management of business applications. Applications are loaded once at the server, thus eliminating the need to visit each desktop to load and maintain applications. Server-based computing, coupled with thin client devices, can reduce system management costs and application implementation and management costs while minimizing overall security risks. This solution typically attains ROI through these significant cost savings within the first 12 months of operation.

Since 2000 IT Solutions has been a leading technology services company. With deep industry expertise and proven experience in consulting and outsourcing, IT Solutions can mobilize the right people, skills alliances and technologies for your Thin Client Technology.
